Athulyam Homes Guest Manager — Setup Guide

Version 1.3 · 19 October 2026 · Nishank

What you're getting

Two free pieces that work together: a phone app for daily entry, and a Google Sheet that mirrors it for reports, Drive backups and email reminders. Running cost is ₹0.

Piece	What it does	Where data lives	Cost
Phone app (app folder)	Bookings, payments, refunds, expenses, calendar, reports, bills, WhatsApp messages. Works fully offline.	On your phone only	₹0 (GitHub Pages hosting)
Google Sheet + script (sheets folder)	Report tabs, a dated backup file in your Drive every day you sync, reminder emails at 8 AM, 9 AM, 8 PM and the 1st of the month (IST)	Your own Google account	₹0

What has been tested, and what hasn't. As of version 1.3 I tested the calculations, importer, coupons and analytics (82 checks), the Sheet script against simulated Google services (19 checks) and the full app in a headless browser at iPhone 13 screen size (60 checks, including offline use, backup restore, queries, review messages, importing old queries, coupons, analytics and the Excel export). Nothing has been hosted, installed on a real iPhone or Android phone, or run inside your real Google account yet. The test checklist spreadsheet covers those on-device steps for you to tick off.

Why not a native iPhone app? A native Swift app needs a Mac with Xcode, and on a free Apple ID it must be reinstalled from the Mac every few days. A paid Apple Developer account removes that. The web app route avoids both and also works on your Android phone.

Step 1 — Put the app online free (about 15 minutes, on your laptop)

The app must be served from an https web address before a phone can install it. GitHub Pages does this free for public repositories (GitHub Docs). The repository holds only the app's code; guest data never goes there.

1. Unzip `athulyam-guest-manager.zip` on your Windows laptop or MacBook. You'll see an `app` folder and a `sheets` folder.
2. Go to github.com and sign up (free). Verify your email.
3. Click **+** (top right) → **New repository**. Name: `athulyam`. Choose **Public**. Click **Create repository**.
4. On the empty repository page, click the link **uploading an existing file**.
5. Open the `app` folder on your laptop, select everything inside it (`index.html`, `app.js`, `logic.js`, `sw.js`, `manifest.json` and the `icons` folder) and drag it all onto the GitHub page. Upload the files themselves, not the `app` folder.
6. Wait until every file shows in the list, then click **Commit changes**.
7. Click **Settings** → **Pages** (left sidebar). Under **Source** choose **Deploy from a branch**, branch **main**, folder **/ (root)**, then **Save**.
8. Wait 1–3 minutes and refresh. A box shows your address: `https://YOUR-USERNAME.github.io/athulyam/`. Open it on your laptop; you should see the green Athulyam Homes screen.

What you should see when it works: the Home screen with an **Add New Booking** button and “No check-ins today”.

Free alternative: Netlify Drop (drag the folder onto app.netlify.com/drop). Its free plan now runs on 300 credits a month with each deploy costing 15 credits, and sites pause if credits run out (netli.fyi, verified against Netlify docs July 2026). Fine for this app, but GitHub Pages has no such meter.

Step 2 — Install on your phone and set it up (10 minutes)

Pick one phone as your main one. Each phone keeps its own separate copy of the data, so entering bookings on two phones splits your records.

iPhone

1. Open **Safari** (must be Safari) and go to `https://YOUR-USERNAME.github.io/athulyam/`.
2. Tap the **Share** button → **Add to Home Screen** → **Add**.
3. Open the app from the new **Athulyam** icon, never from Safari, from now on. Safari tabs and the Home Screen app keep separate data.

Android

1. Open **Chrome** and go to the same address.
2. Tap ⋮ → **Add to Home screen** (or **Install app**) → **Install**.
3. Open it from the icon.

First-time setup in the app (More → Settings)

1. **Business:** address, phone, email and your **GSTIN** (marked FILL IN). These print on guest bills.
2. **GST:** leave **Charge GST on new bookings** ticked. Defaults: room 5% up to ₹7,500 per night, 18% above; food 5%; other charges 18%. Ask your CA to confirm the food and other-charges rates before your first bill.
3. **Rooms:** rename Room 1 and Room 2, set each base tariff per night, tap + **Add room** for more.
4. **Season rate card (optional):** add peak dates with per-room rates. The booking form’s “Fill room charges from rate card” uses them.
5. Tap **Save settings**.
6. **App lock:** tap **Set a PIN** (4–6 digits). A web app cannot use Face ID, so a PIN is the lock. It asks again after 5 minutes away.

Check it works offline: turn on Airplane mode, close the app fully, reopen it from the icon. It should open with your data and an “Offline” badge in the header.

Step 3 — Connect the Google Sheet (20 minutes, on your laptop)

This gives you report tabs, daily Drive backups and the reminder emails. It’s optional, but without it you get no automatic reminders or cloud backup. Google’s screens change from time to time, so button labels may differ slightly from these.

1. Go to sheets.google.com → **Blank spreadsheet**. Name it `Athulyam Homes`.
2. Menu **Extensions** → **Apps Script**. A code editor opens in a new tab.
3. You’ll see a file `Code.gs` with a few lines. Select all of it and delete it. Open `sheets/Code.gs` from the zip in Notepad (Windows) or TextEdit (Mac), copy everything, paste it in. Press **Ctrl+S** / **Cmd+S**.
4. Next to **Files**, click **+** → **Script**. Name it `Logic` (Google adds `.gs`). Delete its starter lines, paste in everything from `sheets/Logic.gs`, save.
5. In the toolbar function dropdown choose **setup**, then click **Run**. Google asks for permission: **Review permissions** → pick your account → if you see “Google hasn’t verified this app”, click **Advanced** → **Go to … (unsafe)** → **Allow**. This warning appears for any personal script; the script only touches this sheet, your Drive backup folder and your own Gmail.

6. Back in the Sheet, a **Setup** tab now shows your **Sync key** (cell B3) and the reminder email address (B4; you can change it).
7. In Apps Script click **Deploy → New deployment** → gear icon → **Web app**. Set **Execute as: Me** and **Who has access: Anyone**. Click **Deploy** and copy the **Web app URL** (ends in `/exec`). "Anyone" is needed so the app can reach it without a Google sign-in; nothing is accepted without the sync key, and opening the URL in a browser shows only a status line.
8. On your phone: **More → Settings → Cloud sync**. Paste the **Web app URL** and the **Sync key** (both marked FILL IN). Tap **Save sync settings**, then **Sync now**. You should see "Synced to Google Sheet" and the Sheet's tabs fill within a minute.
9. In Apps Script choose **testEmail** in the dropdown and click **Run**. A box pops up with the result (or see the Execution log at the bottom). Before your first sync the email is titled "Athulyam · test email"; after a sync it's "Athulyam daily…". Check Spam too.

After this, the app syncs a few seconds after every change whenever you're online. Offline changes wait safely on the phone and go up the next time you're online and make a change or tap **Sync now**.

Free limits: Apps Script on a personal Gmail account allows a limited number of emails per day; this sends at most four. If you ever change the script, use **Deploy → Manage deployments → Edit → New version** so the URL stays the same.

Daily use

The bottom bar has five tabs: Home, Bookings, Rooms (calendar), Reports and More.

Task	Where	Notes
New booking	Home → **Add New Booking**, or tap an empty cell in the Rooms calendar	Food is one amount for the whole room. An advance can be recorded on the same form.
Double booking	Booking form shows a red warning naming the other guest	Saving is blocked until you tick "save anyway (override)". A new guest may check in on the day the previous one checks out.
Payment	Guest page → **Record payment**	Any number of payments; method Cash, UPI, Card, Bank Transfer or Online Platform; optional reference.
Check in / out	Guest page → **Check in**, then **Check out**	Check-out warns if a balance is unpaid and marks the room "Needs cleaning".
Cancellation	Edit booking → Status **Cancelled**	Enter any cancellation fee kept and commission on it; the guest page then shows "Refund due". Record the refund with **Record refund**.
Foreign guest	Booking form → Nationality **Foreign**	Home and the 8 AM email flag Form C until you tick **Form C filed**. The guest page links to the Bureau of Immigration portal.
WhatsApp	Guest page → **Send & share**	Confirmation, payment reminder, thank-you with review request. Opens WhatsApp with the text ready; you press send.
Guest bill PDF	Guest page → **Guest bill (PDF)** → **Print / Save as PDF**	On iPhone, pinch out on the print preview, then Share to save or send. Shows CGST + SGST when GST is on.
OTA payout	Guest page → **Platform payout**	If Booking.com or Airbnb collected from the guest, record that payment as Online Platform, then enter what reached your bank. Reports → OTA payouts shows matched / mismatch.
Expenses	Reports → **Expenses**	Groceries, staff salary, electricity and more; feeds monthly profit.

Task	Where	Notes
Room cleaning	Rooms tab → tap **Clean ✓ / Needs cleaning**	

Tip: use **Cancelled** rather than **Delete** so the history and any cancellation fee stay in your reports. Delete always asks for confirmation and also removes that booking's payments.

Version 1.1 — queries, reviews and feedback

Queries now live apart from bookings, guests get a review request with buttons after check-out, and you get an alert when they send feedback.

Upgrade (15 minutes, on your laptop)

1. **App:** in your GitHub repository click **Add file** → **Upload files**, drag in everything from the new `app` folder, then **Commit changes**. On your phone, close and reopen the app twice to load version 1.1 (More shows the version). Old "Enquiry" bookings move to Queries automatically.
2. **Sheet code:** in Apps Script, replace all of `Code.gs` and all of `Logic.gs` with the new files. Save.
3. Run **setup** once more and allow the new permissions (it now fetches a web address for WhatsApp alerts). Your sync key and the email in B4 are kept.
4. **Redeploy: Deploy** → **Manage deployments** → **pencil icon** → **Version: New version** → **Deploy**. Without this the feedback form won't exist. The URL stays the same.
5. In the app: **More** → **Settings** → **Payments & reviews**. Fill in your **UPI ID**, check the **token amount** (₹500), and replace the **Google review link** (see below). Save, then **Sync now**.

Getting your direct Google review link: sign in to the Google account that manages your Business Profile, search "Athulyam Homes" on Google, click **Ask for reviews** (or **Get more reviews**) and copy the link. Your `share.google` link only opens the listing; this one opens the review box. If the button doesn't show, Google's Place ID Finder plus `https://search.google.com/local/writereview?placeid=YOUR_PLACE_ID` works too.

What changed

Area	How it works now
Queries	New **Queries** tab (bottom bar). Status Open → Answered → Closed. Sending "Thanks for your enquiry" on WhatsApp marks it Answered.
Closing a query	**Closed · Booked** opens a booking form already filled with the guest, channel, dates and quote; add the room and charges and save. **Closed · Not booked** asks for a reason.
Sheet tabs	New **Queries**, **Query conversion** (by channel, by month), **Dashboard**, **Feedback** and **Review consent** tabs. Bookings gains Email, From a query, Review request emailed and Review consent columns.
Dashboard	At the top of the app Home and of the 8 PM email: queries open / answered / closed, conversion %, bookings waiting for check-in / checked in / checked out / cancelled, and paid / part paid / unpaid.
Token request	For a confirmed booking with nothing paid (e.g. free-cancellation OTA bookings): WhatsApp **Token ₹500 request** with stay details, UPI ID and balance due at check-in.
Review request	After **Check out**: WhatsApp **Review request**, and an automatic email (if the guest's email is saved) with buttons **Rate us on Google**, **Rate us on Booking.com / Airbnb / MakeMyTrip** and **Submit feedback**. Direct bookings get Google only, plus an invitation to reply on WhatsApp and permission to share a screenshot.
Feedback form	A Google-hosted page with stars, comments and "May we share your review?". Answers land in **Feedback**;

Area	How it works now
	every “Yes” also lands in **Review consent**. Google adds a small “created by a Google Apps Script user” banner at the top.
Consent from WhatsApp	When a guest replies YES on WhatsApp, record it on their guest page (**Review & feedback** card). It flows to **Review consent** at the next sync.
Alerts to you	Email for every feedback submitted (low ratings flagged). WhatsApp too if you set up CallMeBot.

Limits to know

- WhatsApp messages are sent by you with one tap; free WhatsApp can’t send them automatically. Emails to guests and alerts to you are automatic.
- Only verified guests can review on Booking.com and Airbnb, from their booking in the app, so the button text tells them where to tap. The review emails go out at your next sync after check-out, within 14 days, once per guest.
- The app can’t see reviews posted on Google or OTAs. You’re alerted for the feedback form only.

WhatsApp alerts with CallMeBot (optional, free for personal use)

CallMeBot’s own page currently says the bot is full, so activation may need a few days (CallMeBot, checked 19 Oct 2026). When it reopens: save the number shown on that page in your contacts, send it “I allow callmebot to send me messages” on WhatsApp, and paste the API key it replies with into **Setup → B11**, with your number (e.g. 919876543210) in **B10**. The alert carries only the guest’s first name, channel, rating and consent, never phone numbers or comments.

Version 1.2 — importing your old queries

Your old queries from Numbers go into the app’s **Queries** list, and from there into the Sheet’s **Queries** and **Query conversion** tabs at the next sync. Nothing is typed twice.

Upgrade: upload the new `app` folder files to GitHub again (**Add file → Upload files → Commit changes**), then close and reopen the app twice. **More** should show version 1.2. The Sheet code needs no change for this; replacing `Logic.gs` with the new copy is optional and keeps both identical.

The columns (template: `athulyam-old-queries-template.xlsx`)

Column	Required	Format	Goes to
Received date	Yes	19/10/2026 (day first)	Received; decides the month for conversion %
Guest name	Yes	Text	Guest
Mobile	No	9876543210	Phone, for WhatsApp
Email	No	name@example.com	Email
Channel	No	Direct Booking, Booking.com, Airbnb, MakeMyTrip, Goibibo, Agoda, Google, Travel Agent, Other	Channel; conversion by channel
Check-in date	No	25/10/2026	Check-in
Check-out date	No	27/10/2026	Check-out
Adults	No	Number (blank = 2)	Adults
Children	No	Number (blank = 0)	Children
Room	No	Room name as in app Settings	Room (unknown names kept in Notes)
Quote ₹	No	7000	Quote; becomes room charges if you later create the booking
Status	No	Open, Answered, Closed	Status

Column	Required	Format	Goes to
Outcome	If Closed	Booked, Not booked	Outcome; Booked counts as converted
Reason not booked	No	Text	Reason not booked
What they asked	No	Text	What they asked
Notes	No	Text	Notes

You don’t have to use the template. The import screen matches your own headings automatically (for example “Contact No” → Mobile, “Source” → Channel, “Arrival” → Check-in, “Pax” → Adults) and lets you correct any match before importing.

What it understands without editing your sheet

- **Dates:** 19/10/2026, 19-10-26, 19 Oct 2026, 2026-10-19 and Oct 19, 2026. Choose “Month first” on the screen if your sheet uses 10/19/2026.
- **Status:** Booked, Converted, Confirmed or Yes → Closed · Booked. Lost, Not booked, Cancelled or No → Closed · Not booked. Quoted, Replied, Follow-up or Pending → Answered. Blank → Open.
- **Channel:** MMT → MakeMyTrip, BDC or booking → Booking.com. Walk-in, phone, WhatsApp or Instagram → Direct Booking (the original word is kept in Notes). Anything unknown → Other (also kept in Notes).
- **Money:** ₹7,000, Rs 7000 and 7,000.00 all become 7000.
- Anything it can’t read (a wrong date, an unknown room, a bad email) is still imported, with the original text saved in Notes. Rows with no guest name, or no received date and no check-in date, are left out. You can download them as a CSV to fix and import again.

Steps by device

Device	Get the data out	Bring it into the app
MacBook (Numbers)	Open your old file. Either rearrange it into the template’s columns, or keep your own headings. **File → Export To → CSV**, choose only the queries table, save.	Send the CSV to your phone by AirDrop, email or iCloud Drive, then import as below.
iPhone (Numbers)	Open the file, **•••** → **Export** → **CSV** → **Save to Files**.	App → **More** → **Import old queries** → **CSV file** → pick it → **Read my data**.
Any device, no file	Select the cells **including the heading row**, copy.	Paste into **…or paste cells here** → **Read my data**.
Windows (Excel)	**File → Save As → CSV UTF-8**.	Send the CSV to your phone, then import as above.
Android (Google Sheets or Excel)	Sheets: ⋮ → **Share & export** → **Save as** → **CSV**. Excel: **Save a copy** → **CSV**.	Import as above.

Import on the phone you use as your main one. Each phone keeps its own copy of the data.

Then:

1. Check the column matches in step 2 on the screen. Look at the preview counts: open, answered, booked, not booked.
2. Tap **Import**. The queries appear under **Queries → All**, dated by their real received date, so past months’ conversion % is correct.
3. Tap **Sync now** (More → Settings). The Sheet’s **Queries**, **Query conversion** and **Dashboard** tabs update.
4. Importing the same file again is safe: rows already in the app are skipped. Each import has an **Undo** button on the import screen.

Old queries marked Booked don’t create bookings automatically, because they don’t carry room charges or payments. On any of them you can tap **Create the booking** if you want that stay in your revenue reports.

Version 1.3 — analytics reports and coupons

Upgrade: upload the new `app` folder files to GitHub (there's one new file, `xlsx.js`), and replace `Code.gs` and `Logic.gs` in Apps Script. Then **Deploy → Manage deployments → Edit → Version: New version → Deploy**. Close and reopen the app twice; **More** shows version 1.3.

Analytics & export (Reports → Analytics & export)

Filter	Choices
Period	Last week (Mon–Sun), This week, Last month, This month to date, Last 30 days, Last year, This year to date, Season (from Settings → Season rate card), Custom dates
Compare with	Previous period (whole months compare with the previous months, month-to-date with the same days last month), Same period last year, Custom dates, No comparison
Channels	All channels (default), or tap any mix of channels

- **On screen:** 12 figure cards with ▲/▼ change against the comparison (green when better, red when worse). The figures are gross revenue, net after commission, room nights, occupancy, average room rate, bookings, queries, conversion, money collected, coupons given, commission and profit.
- **Charts:** gross revenue over time, gross revenue by channel, bookings by channel, and queries converted by channel.
- **Download Excel:** a real `.xlsx` that opens in Excel, Numbers and Google Sheets. It has six sheets: Summary (with change %), Charts (3 native charts), By channel, Trend, Bookings and Queries, all filtered to your choices.
- **Save as PDF:** opens the print screen with a clean 2-page report: filters, buttons and menu hidden, charts kept in colour. On iPhone, tap **Print**, pinch out on the preview, then **Share → Save to Files**. On Android or a laptop, choose **Save as PDF** as the printer.
- **How it counts:** revenue counts nights stayed inside the period, so a stay across month-end is split. Money collected counts payments received inside the period. Expenses and profit appear only with All channels, because expenses aren't tied to a channel.

Coupons

Where	How
Booking form	**Coupon**: No coupon, 5%, 10%, 15%, Custom %, or Custom ₹ amount. A code is made automatically (e.g. ATH10-K7QM, or ATHR500-K7QM for ₹500 off); you can type your own.
Query page	**Offer a coupon** → 5% / 10% / 15% / Custom % / Custom ₹ → **WhatsApp: Send coupon offer**. The message gives the code, the price after the coupon and the valid-until date. Closing the query as booked carries the coupon into the booking.
Reminder	Home (red alert), the query list ("Offer a coupon?") and the 8 AM email flag every **Direct** query that is still Open or Answered, arrives **tomorrow or today**, and has at least one room free for its dates. If every room is already booked, no coupon is suggested.
Settings	**Coupon code prefix** (default ATH).

The coupon comes off after any manual discount and before GST. Taxable value, GST, turnover, the GST summary, every report and the bill all use the price the guest actually pays. Example: ₹6,000 room + ₹1,000 food with 10% off comes to ₹6,300 taxable, ₹315 GST and a ₹6,615 bill. Coupons show as their own line on the bill, in reports and in the Sheet's Bookings tab (Coupon code, Coupon ₹).

How the numbers work

One calculation file (`logic.js`) is used by both the app and the Sheet, so they always agree.

Taxable = Room + Food + Additional − Discount − Coupon

Total bill = Taxable + GST

Outstanding = Total bill − (Payments − Refunds)

Net after commission = Taxable − Commission

- **Commission** is your expense. It never changes the guest's bill.
- **GST** is shown separately and left out of net revenue, because it is collected for the government, not earned. This is the one place I changed your brief's formula (Net = Total Bill − Commission); with GST on, the brief's version would count GST as income.
- **Discount** is shared across room, food and other charges in proportion before GST is worked out.
- **Room GST rate** is picked automatically per booking: room charge after discount ÷ nights, 5% up to ₹7,500, 18% above. You can override it on the form.
- **Daily and monthly revenue** spread each stay evenly over its nights. A 2-night ₹4,000 stay adds ₹2,000 to each night's date, so a stay across month-end is split correctly and never counted twice.
- **Collections** are counted on the date money was received, separate from revenue.
- **Platform report** groups bookings by arrival date with their full amounts, so each booking appears once.
- **GST summary** dates each bill on the check-out date, which is also the bill date printed on the invoice.
- **Enquiries** never count as revenue and don't block rooms. **Cancelled** bookings count only the fee you kept, on the cancellation date.
- **Payment flags:** "Due today" on arrival day, "Overdue" from the next day, "No advance yet" for confirmed future stays with nothing paid.

Reminders

The app doesn't fake notifications. A home-screen web app can't schedule its own alerts while closed, and true web push needs a server that would have to hold your guest data. So reminders come two reliable, free ways:

Reminder	Default time (IST)	How it arrives
Today's arrivals, departures, Form C due, tomorrow's arrivals	8 AM	Email from your Sheet
Pending balances, overdue, unpaid advances, refunds owed	9 AM	Email from your Sheet
Daily revenue and collections	8 PM	Email from your Sheet
Previous month's summary	9 AM on the 1st	Email from your Sheet
Same four prompts, plus each confirmed arrival	Your chosen times	Phone calendar alarms (More → Reminders → add to calendar)

- Change times in **More → Reminders**; they reach the Sheet at the next sync.
- Emails go out **within** the chosen hour: Google's hourly timer runs once an hour, not at an exact minute (Apps Script ClockTriggerBuilder docs).
- Emails use the data from your last sync and say when that was. If it's over 24 hours old the note turns red.
- Turn on Gmail notifications on your phone so these emails pop up like app alerts.
- Calendar alarms work without internet but carry no figures; they're a nudge to open the app. On iPhone, after tapping the button choose your Calendar app from the share sheet; this step is on the test checklist to confirm on your phone.

Data, privacy and backups

Your records live in the app's private storage on your phone, protected by the phone's own encryption and passcode. The GitHub site holds code only.

- **Biggest risk:** deleting the Home Screen icon, or clearing Safari website data, can erase the phone copy. Keep sync on or export a backup weekly. Home shows a warning when neither has happened for 7 days (changeable in Settings).
- **Backup file:** More → Backup & restore → **Export backup**. It contains settings, rooms, bookings, guest names, phones, stored ID characters, payments and expenses. It leaves out your PIN and sync key. It is not encrypted, so save it to your own Drive or iCloud Files and never post it publicly.
- **Cloud copies:** each sync writes a dated file (`athulyam-backup-YYYY-MM-DD.json`) into the **Athulyam Homes Backups** folder in your Drive and keeps the last 45 days.
- **Restore: Merge** adds missing records and updates older ones by record ID, so nothing duplicates. **Replace** wipes the phone first and asks you to confirm.
- **Guest ID:** by default only the last 4 characters are stored. Switch to full ID in Settings only if the legal register requires it (see the next section).
- **Delete everything:** More → Backup & restore → **Delete everything on this phone**, confirmed by typing DELETE. To remove the cloud copy, delete the Sheet and the backup folder in Drive.
- **Spreadsheet exports:** CSV of bookings, payments and expenses from the same screen; every report also has **Export CSV** and **Print / Save PDF**.

Updating the app later: upload changed files to the same GitHub repository (replace the old ones). The app shows the new version after it is closed and reopened twice. Your data is untouched by updates.

Assumptions to confirm

Each of these is a setting or a one-line change, not a rebuild.

Assumption	Why it matters	Who settles it	If it's wrong
Food GST 5% (property not a "specified premises")	Sources disagree on whether food GST follows each room or the whole property's previous-year tariffs	Your CA	Change Food GST % in Settings
Additional charges GST 18%	Bonfire, taxi and similar may follow the main supply's rate instead	Your CA	Change Other GST % in Settings, or per booking
No GST on cancellation fees	Treatment of retained cancellation charges varies	Your CA	Ask me to add a GST rate for fees
Bill date = check-out date	GST timing and invoice numbering	Your CA	Invoice numbers use AH-checkout date-ID and can be changed
ID stored as last 4 characters	Hosts must keep a guest register (Form B) for Indian and foreign guests; it may need full ID details	Local police station or Uttarakhand homestay registration office	Settings → Guest ID storage → Full ID number
Form C within 24 hours for every foreign guest	Legal requirement for anyone hosting foreigners for payment	Confirmed by india.gov.in and Airbnb host guidance	—
One main phone for entry	Each phone keeps its own copy; sync goes phone → Sheet only	You	Ask me for two-way sync if two people will enter bookings

GST sources: accommodation up to ₹7,500 per unit per day moved from 12% to 5% without ITC from 22 September 2025 (Shriram Finance); food at a hotel with room tariff up to ₹7,500 is 5% (DisyTax).

Troubleshooting

Problem	Likely cause	Fix
GitHub address shows 404	Pages not switched on yet, or files uploaded inside an app folder	Wait 3 minutes; check Settings → Pages; index.html must sit at the top of the repository

Problem	Likely cause	Fix
No “Add to Home Screen” on iPhone	Opened in Chrome or another browser	Open the address in Safari
My bookings disappeared	Opened in a Safari tab instead of the icon, or website data was cleared	Open from the icon; restore the latest backup (phone file or Drive folder) with Merge
“Sync failed: Wrong sync key”	Key copied with a missing character	Copy cell B3 of the Setup tab again
“Unexpected reply from Google”	Web app access not set to Anyone, or URL is the editor link	Redeploy with Who has access: Anyone; use the URL ending in /exec
No reminder emails	Sheet never synced, or reminders off	Tap Sync now; check More → Reminders; run **testEmail** in Apps Script
Forgot PIN	—	Delete the Home Screen icon, re-add it, restore your latest backup
A screen looks wrong or a number seems off	—	Send me a screenshot and the steps; I’ll explain the cause and give you the full corrected file
